## **ABSTRACT**

**Objective:** To examine the effects of short-, medium- and long-term resistance exercise training (RET) on measures of cardio-metabolic health in adults.

**Design:** Intervention systematic review

**Data sources:** MEDLINE and Cochrane Library databases were searched from inception to February 2018. The search strategy included the keywords: resistance exercise, strength training, randomised controlled trial.

**Eligibility criteria for selecting studies:** RCTs published in English comparing RET >2 weeks in duration with a non-exercising control or usual care group. Participants were non-athletic and aged ≥18 years.

**Results:** A total of 173 trials were included. Medium- and long-term RET reduced systolic blood pressure (-4.02 [95% CI: -5.92, -2.11], mmHg  $P < 0.0001$  and -5.08 [-10.04, -0.13] mmHg,  $P = 0.04$ , respectively) and diastolic blood pressure (-1.73 [-2.88, -0.57] mmHg,  $P = 0.003$  and -4.93 [-8.58, -1.28] mmHg,  $P = 0.008$ , respectively) versus control. Medium-term RET elicited reductions in fasted insulin and insulin resistance (-0.59 [-0.97, -0.21]  $\mu\text{U/ml}$ ,  $P = 0.002$  and -1.22 [-2.29, -0.15]  $\mu\text{U/ml}$ ,  $P = 0.02$ , respectively). The effects were greater in those with elevated cardio-metabolic risk or disease compared to younger healthy adults. The quality of evidence was low or very low for all outcomes. There was limited evidence of adverse events.

**Conclusions:** RET may be effective for inducing improvements in cardio-metabolic health outcomes in healthy adults and those with an adverse cardio-metabolic risk profile.

**KEYWORDS:** cardiovascular, exercise training, systematic review, strength training

## INTRODUCTION

Cardiovascular disease is a substantial human and economic burden, responsible for 17.7 million deaths globally in 2015 [1]. The positive impact of regular moderate to vigorous intensity aerobic exercise (e.g. brisk walking, jogging, cycling) on cardio-metabolic health, including improvements in cardiopulmonary exercise capacity, blood pressure, glycaemic control, hypercholesterolemia and vascular endothelial function [2, 3], is well-documented and recognised in current UK and global physical activity recommendations [4, 5]. However, while the health benefits of regular resistance exercise training (RET) in relation to maintaining skeletal muscle size and strength are also recognised in current physical activity recommendations, the role of RET in enhancing cardio-metabolic health is less well defined.

RET is characterised by muscular activities working against an external load and may be easier than aerobic exercise to implement and sustain in the home environment as it offers an alternative way to exercise for older adults who have limited space or access to equipment and time availability [6-8]. Most studies of RET have focused on changes in skeletal muscle size and strength, with few investigating cardio-metabolic health effects as primary outcomes although several have reported cardio-metabolic variables as secondary outcomes [9, 6, 10].

There is preliminary evidence that RET may positively alter blood lipid profile, body composition, systolic blood pressure [11-13], circulating inflammatory markers and cardiopulmonary exercise capacity [14, 15, 2]. RET may also generate longer-lasting improvements in body fat, fasted insulin, lipid profile and systolic blood pressure than aerobic exercise [16, 17]. Finally, RET may have an important role in attenuating age-related physiological changes such as increases in systolic blood pressure and arterial stiffness, and the reduction of skeletal muscle mass (with associated changes in systemic physiology) [18, 3].

Aside from the lack of RET intervention studies with a primary focus on cardio-metabolic health outcomes, interpreting the impact of RET on cardio-metabolic health is constrained by heterogeneity of methodology, including the duration of interventions and populations. High-quality systematic reviews and meta-analyses can help to overcome these challenges, while accounting for bias and heterogeneity, by providing more precise estimates of effect size changes. The aim of this systematic review was

to assess the effects of short-, medium- and long-term RET programmes compared to control or usual care on cardio-metabolic health outcomes in adults.

## **METHODS**

The preferred reporting items for systematic review and meta-analyses (PRISMA) guidelines were followed [19] when conducting and reporting this prospectively registered systematic review (PROSPERO ID CRD42016037946).

### **Eligibility criteria**

We included randomised controlled trials (RCTs) published in English that compared any RET programme alone to a non-exercising control or usual care group. Participants must have been aged  $\geq 18$  years, non-athletic [20], and recruited to a RET programme (e.g. elastic resistance band, weight machines, etc.) of at least 2 weeks duration, irrespective of intensity or frequency that was conducted in any setting (e.g. home, hospital). We included studies where isometric RET with whole body vibration was used. We excluded studies where RET interventions were combined with other lifestyle components or exercise modes (e.g. aerobic exercise, diet, etc.) to isolate the effects of RET. Studies that included at least one of the following cardio-metabolic health outcomes or clinical end-points were eligible:  $\dot{V}O_2\text{max}$ ; flow-mediated dilatation; C-reactive protein; total cholesterol; high-density lipoprotein cholesterol; low-density lipoprotein cholesterol; triglycerides; fasted glucose; fasted insulin; insulin resistance (HOMA-IR); resting blood pressure; mean arterial pressure; resting heart rate; cardiovascular mortality; all-cause mortality; non-fatal end-points (e.g. myocardial infarction, coronary artery bypass grafting; percutaneous transluminal coronary angioplasty; angina or angiographically-defined coronary heart disease; stroke; carotid endarterectomy; peripheral arterial disease).

### **Search strategy**

The MEDLINE Ovid and Cochrane Library databases were searched from inception to February 2018. The search strategy keywords and MeSH terms used included: progressive resistance, strength training, exercise and randomised controlled trial. Details of the full search strategy can be found in supplementary table 1. Reference lists of all relevant systematic reviews identified were searched for additional studies.

All searches were conducted by the same author (RA), with search results collated using EndNote software (Thomson Reuters, New York), and duplicates removed.

The first 10% of titles and abstracts were screened independently by two reviewers (RA and GT) and, due to good agreement, the remaining texts were screened by one reviewer only (RA, GT, JS or LL) [21]. Screening of full-texts was performed by two independent reviewers (RA and GT) with disagreements resolved through consensus or a third reviewer being consulted (JS).

### **Data extraction**

Two authors (RA and SG) independently extracted data using Microsoft Excel. Any disagreements were resolved via consensus. When more than one publication was apparent for the same trial, data were collated (supplementary table 2). We extracted study design, participant demographics, intervention details and means and standard deviations for all outcomes. When necessary, published protocols and trial registries were searched for further methodological detail and risk of bias assessment. If there was insufficient information the authors (n = 40) were contacted via email. Resting blood pressure was expressed in millimetres of mercury (mmHg); resting heart rate in beats per minute (bpm),  $\dot{V}O_2$ max relative to body mass (ml/kg/min), flow-mediated dilatation as percentage, fasted insulin in micro units per millilitre ( $\mu$ U/ml), C-reactive protein in milligrams per litre (mg/L) and glucose, lipid profile and HOMA-IR in milligrams per decilitre (mg/dL). Adverse events were also extracted.

### **Risk of bias**

Risk of bias was assessed by two authors independently (RA and SG) using the Cochrane Risk of Bias tool [22]. Any disagreements were resolved through consensus. We judged risk of bias on the study level as 'low', 'unclear' or 'high' risk [23]. We used funnel plots to assess publication bias when there were more than 10 studies contributing data for an analysis [24, 23]. For all outcomes we conducted sensitivity analyses. For the sensitivity analyses, we excluded studies that were judged as being at unclear risk of bias on a majority of domains of the Cochrane tool, or where at least 2 domains of the Cochrane tool were judged as being at high risk of bias, and ran the meta-analysis again.

### **Data synthesis**

Meta-analyses were undertaken using Review Manager (RevMan 5.3; Cochrane Collaboration, Oxford, UK) when more than two studies reported on the same outcome. In the pooled analysis of studies by duration, outcome data were organised into short-term ( $\leq 6$  weeks), medium-term (7-23 weeks) and long-term ( $\geq 24$  weeks) arbitrary categories. Where units of measurement could not be converted, standardised mean differences (SMD) were used. Data are presented as mean and 95% confidence intervals. The  $I^2$  statistic was used to quantify statistical heterogeneity as follows: 0-40%: might not be important, 30-60%: moderate heterogeneity, 50-90%: substantial heterogeneity, 75-100%: considerable heterogeneity [23]. Fixed-effects model was used for analysis however, if statistical heterogeneity was noted ( $I^2 > 40\%$ ), meta-analysis was performed using a random-effects model. The GRADE approach was used to assess the strength of evidence. Studies were downgraded if there were issues with risk of bias, consistency, precision or directness of the outcomes. The reasons for downgrading the evidence are outlined in Table 1.

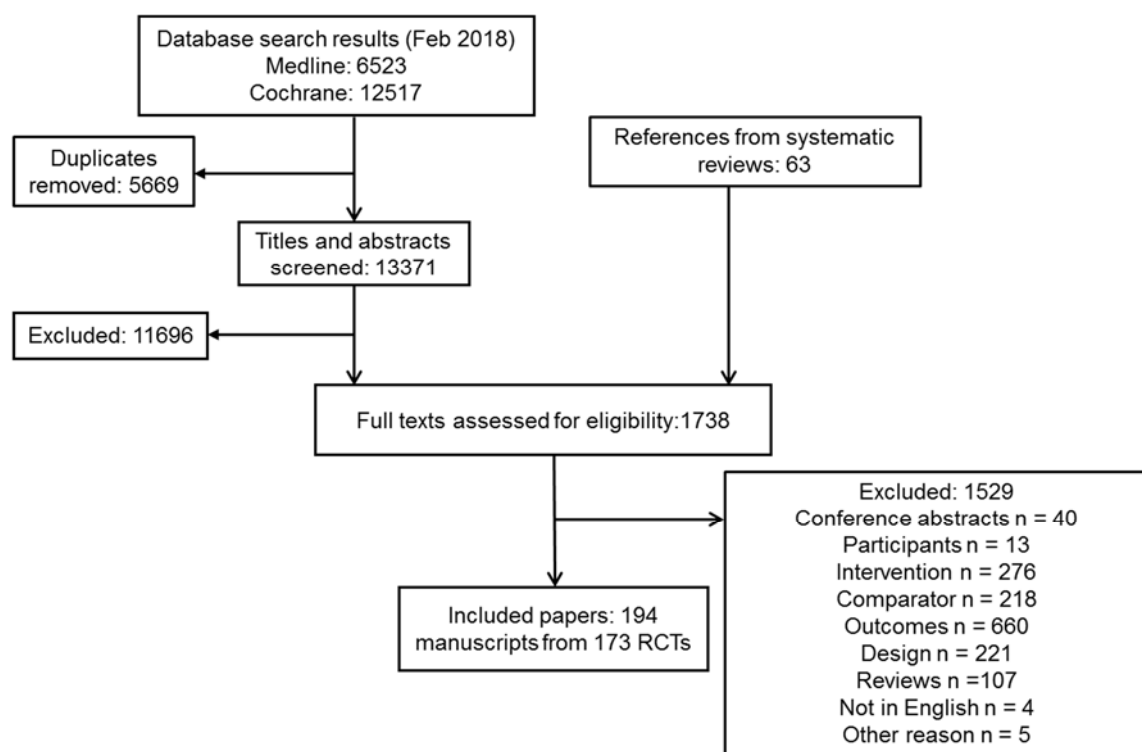

**Table 1.** Criteria for downgrading the quality of outcomes using the GRADE approach.

	<b>Reason to downgrade the level of evidence</b>
<b>Risk of bias</b>	<ul style="list-style-type: none"> <li>Majority of studies rated as being at unclear risk of bias</li> <li>Outcome includes studies that have been rated as being at high risk of bias in 2 or more categories</li> </ul>
<b>Inconsistency</b>	<ul style="list-style-type: none"> <li>Large heterogeneity based on the similarity of point estimates, statistical heterogeneity and <math>I^2 \geq 50\%</math></li> </ul>
<b>Imprecision</b>	<ul style="list-style-type: none"> <li>Large confidence intervals when data are presented as standardised mean difference</li> <li>Substantial heterogeneity (<math>I^2 \geq 50\%</math>)</li> <li>If a recommendation or clinical course of action would differ if the upper versus the lower boundary of the confidence interval represented the truth</li> <li>Sample size <math>&lt; 400</math> within the meta-analysis for each variable</li> </ul>
<b>Indirectness</b>	<ul style="list-style-type: none"> <li>Use of surrogate outcomes</li> </ul>
<b>Publication bias</b>	<ul style="list-style-type: none"> <li>Asymmetric funnel plot</li> </ul>

Where multiple RET groups were compared to a single control group, data for the intervention most similar to traditional RET was used for the analysis. After the initial analysis, sub-group analyses were conducted to explore sources of heterogeneity by dividing studies into three categories: healthy young adults aged 18-40 years; healthy older adults  $\geq 41$  years old; older adults  $\geq 41$  years old with elevated cardio-metabolic risk or established disease (defined as any elevated blood marker above normal levels or overweight, obese or hypertensive participants). Adverse events were synthesised descriptively.

## RESULTS

A total of 19,040 records were retrieved from database searches, of which 5,669 records were duplicates. A further 11,696 were then eliminated following screening of titles and abstracts (Figure 1). Sixty-three potentially relevant papers were identified from screening of systematic review reference lists (Figure 1). After full-text screening of 1,738 articles, 194 manuscripts from 173 RCTs were included in this review (Figure 1). Participants were individually randomised in all included trials (i.e. there were no cluster RCTs).

**Figure 1.** PRISMA flow diagram

## Study characteristics

The 173 RCTs comprised 6,169 participants (2,840 control and 3,329 RET participants), with sample sizes of 5-77 per group and 13-150 per study. One hundred studies involved healthy individuals and 73 studies involved clinical populations. All included studies were published between 1978 and February 2018. Summary details of the included trials and populations are presented in supplementary table 2 and 3 respectively.

RET programmes mainly used weight machines (n = 90 studies; 52%), a mix of free weights, bodyweight and machine exercises (n = 43 studies; 25%), elastic resistance bands (n = 13 studies; 8%), circuit exercises (n = 12 studies; 7%), free weights (n = 10 studies; 6%), ankle/leg weights (n = 2 studies; 1%), isometric hand grip (n = 2 studies; 1%) and isometric exercise with whole body vibration (n = 1 study).

The majority of interventions were supervised by an exercise professional (n = 105 studies; 61%). One study reported data from an unsupervised intervention, and 13 (8%) used a combination of supervised and unsupervised programmes. Fifty-four studies (31%) did not report the level of supervision.

The duration of the intervention varied from  $\leq 6$  weeks (n = 13), 7-23 weeks (n = 129) and  $\geq 24$  weeks (n = 31). The most common frequency of training was 3 sessions per week (n = 110), followed by 2 sessions per week (n = 36), though some studies required participants to complete the programme in 1, 4 or 5 sessions per week (n = 1, n = 7 and n = 5, respectively). The remaining studies stipulated either two-three sessions per week (n = 8), three-four sessions per week (n = 1) or did not report the frequency (n = 5).

In the majority of studies, control participants were instructed to continue with their habitual activity (n = 115/173) or were allocated to usual care (n = 15). Three studies provided lifestyle advice to the control group and discussion about physical activity levels, but no structured/supervised exercise (n = 3). Forty studies did not report the requirements of the control group. The included studies did not report any clinical endpoints. A summary of the quality of evidence, based on risk of bias, study design, confidence intervals and variability in results, has been collated using the GRADE approach (Table 2).

**Table 2.** GRADE summary of findings.

Outcome		Anticipated absolute effects (95% CI)		Number of participants (RCTs)	Certainty
		Risk with control group	Risk with resistance exercise training		
Cardiovascular morbidity/mortality		Could not be calculated due to lack of reporting.			
Systolic blood pressure (mmHg)	ST	115.45 mmHg	MD 3.17 mmHg lower (6.95 lower to 0.6 higher)	116 (4 RCTs)	⊕○○○ VERY LOW <sup>a,b,c</sup>

CI - Confidence interval; RCTs – randomised controlled trials; MD – mean difference; ST – short term; MT – medium term; LT – long term  
a – Downgraded due to being a surrogate outcome.  
b – Downgraded due to potential for a recommendation or clinical course of action differing if the upper versus the lower boundary of the CI represented the truth and/or a sample size <400.  
c – Publication bias suspected after inspection of funnel plots.  
d – Inconsistent due to high heterogeneity, non-overlap of CI and/or markedly dissimilar point estimates.  
e – Risk of bias was judged to be high.

## **Risk of bias**

Figure 2 shows a summary of the risk of bias decisions made per category for the included studies. Supplementary table 4 describes risk of bias for each study in detail.

### **Selection bias**

An acceptable method of random sequence generation (i.e. computer generated) was used in 36 studies, 8 studies were judged as being at high risk of bias and the remaining 129 studies were judged as being at unclear risk due to insufficient information to determine randomisation methods. The majority of studies (n = 156) did not report allocation concealment and were judged as unclear. Fourteen studies were judged as being at low risk of bias as allocation was blinded. In 3 studies, the researchers were not blinded to the allocation process and we judged these studies as being at high risk of bias.

### **Performance and detection bias**

All trials were at high risk of performance bias (i.e. blinding of participants to the intervention and outcomes). Lack of investigator blinding could have influenced measures of resting blood pressure and flow-mediated dilatation but is more likely to have had an impact on the motivation provided to participants during  $\dot{V}O_2$ max tests. The majority of studies (n = 144) were rated as unclear for detection bias (i.e. blinding of outcome assessor) due to insufficient information provided in the studies. Two studies were at high risk of detection bias, with the remaining 27 studies at low risk.

### **Attrition bias**

The majority (n = 122) of studies were judged as being at low risk for incomplete outcome data. A further 37 studies were rated as unclear risk due to attrition rates >20% in one of the study groups (i.e. control or RET). Few studies were rated as high risk (14) due to high dropout rates or some participants being excluded from the analysis.

### **Reporting bias**

The majority (n = 166) of studies were rated as low risk for selective reporting bias. A further 4 studies were classed as unclear due to a lack of description of outcome measures and 3 studies rated as high risk as data for some outcomes were not reported.

## Publication bias

Funnel plots were produced for all outcomes, except flow-mediated dilatation (supplementary Figures 1-13). All funnel plots were asymmetrical, indicating publication bias.

## Sensitivity analysis

Results from the sensitivity analysis are summarised in supplementary table 9. Heterogeneity was reduced in 16/33 outcomes. The most considerable reductions were in those outcomes with fewer studies such as short-term systolic and diastolic blood pressure and long-term total and high-density lipoprotein cholesterol and these results could alter the main findings. However, in the outcomes with more studies (e.g. total cholesterol, high-density lipoprotein cholesterol) it is unlikely that this sensitivity analysis will alter the main findings.

## GRADE analysis

All outcomes were rated as very low or low quality evidence demonstrating that the estimate of effect for those outcomes is uncertain.

**Figure 2.** Risk of bias summary.

A summary of the change observed for each outcome at all durations is presented as mean difference and 95% CI in Figure 3.

## Resting blood pressure and heart rate

Resting blood pressure and resting heart rate are presented in Table 3 and Supplementary Figures 14-17. Favourable reductions in systolic blood pressure (in the

range 3-5 mmHg;  $P \leq 0.04$ ) and diastolic blood pressure (in the range 1-5 mmHg;  $P \leq 0.008$ ) were apparent after medium- and long-term RET interventions (Table 1), with studies showing moderate to substantial heterogeneity ( $I^2$  range of 64-86%). There were non-significant effects for mean arterial pressure and resting heart rate after short- and medium-term RET interventions (Table 3 and Supplementary Figures 16-17).

### **$\dot{V}O_{2\max}$**

The effect of RET on  $\dot{V}O_{2\max}$  is presented in Supplementary Figure 18. There was an improvement in  $\dot{V}O_{2\max}$  with RET and moderate heterogeneity (mean difference 2.07 [95% confidence interval 0.75, 3.39] ml/kg/min,  $P = 0.002$ ;  $\chi^2 = 11.35$ ,  $I^2 = 30\%$ ,  $P = 0.18$ ) in short-term studies ( $n=9$ ; resistance arm:  $n = 177$ ; control arm:  $n = 131$ ). In medium-term studies ( $n = 48$ ; resistance arm:  $n = 767$ ; control arm:  $n = 687$ ) there was a significant improvement in  $\dot{V}O_{2\max}$  with RET and substantial heterogeneity (mean difference 1.07 [95% confidence interval 0.38, 1.76] ml/kg/min,  $P = 0.002$ ;  $\chi^2 = 160.15$ ,  $I^2 = 71\%$ ,  $P < 0.00001$ ). In long-term studies ( $n = 11$ ; resistance arm:  $n = 213$ ; control arm:  $n = 186$ ) there was a significant improvement in  $\dot{V}O_{2\max}$  with RET (mean difference 1.22 [95% confidence interval 0.44, 2.0] ml/kg/min,  $P = 0.002$ ;  $\chi^2 = 10.22$ ,  $I^2 = 2\%$ ,  $P = 0.42$ ).

### **Flow-mediated dilatation**

Eight studies reported flow-mediated dilatation, however due to missing data, only six studies (resistance arm:  $n = 68$ ; control arm:  $n = 70$ ), all medium-term, were included in the meta-analysis (Supplementary Figure 19). There was a significant improvement in flow-mediated dilatation favouring RET (1.69 [0.97, 2.41],  $P < 0.0001$ ) with low heterogeneity ( $\chi^2 = 0.72$ ,  $I^2 = 0\%$ ,  $P = 0.98$ ). One short-term study [25] and one long-term study [26] reported improvements in flow-mediated dilatation after RET.

### **Blood biomarkers**

Blood biomarkers are presented in Table 4 and Supplementary Figures 20-27. Non-significant effects were observed for total cholesterol, low-density lipoprotein cholesterol, high-density lipoprotein cholesterol, triglycerides and C-reactive protein across the different study durations (Supplementary Figures 20-23 and 27). Significant reductions in fasted insulin ( $P = 0.002$ ) and HOMA-IR ( $P = 0.02$ ) were evident after medium-term but not long-term RET interventions. There was a significant reduction in fasted glucose after medium-term ( $P = 0.02$ ) but not short- or long-term RET interventions.

**Table 4.** The effects of short- (ST), medium- (MT) and long-term (LT) RET on blood biomarkers

## Sub-group analyses

When comparing healthy young adults  $\leq 40$  years ( $n = 44$ ) with healthy older adults  $\geq 41$  years ( $n = 50$ ), there was a greater magnitude of cardio-metabolic benefit from RET in the older populations (supplementary tables 5 and 6). There were significant reductions in systolic blood pressure with medium-term RET interventions for healthy older adults compared to healthy younger adults ( $-4.36$  [ $-5.73$ ,  $-2.99$ ] mmHg,  $P < 0.00001$ , versus  $-0.56$  [ $-1.57$ ,  $0.44$ ] mmHg,  $P = 0.27$ , respectively) (supplementary table 5 and 6). In the healthy older adults there were significant improvements in systolic blood pressure, diastolic blood pressure, mean arterial pressure, resting heart rate, total cholesterol, high-density lipoprotein cholesterol, triglycerides, fasted insulin, fasted glucose and C-reactive protein following medium-term interventions compared to younger adults for the same intervention duration. Significant improvements after long-term interventions were also apparent for diastolic blood pressure,  $\dot{V}O_2\text{max}$ , total cholesterol and fasted glucose in healthy older adults  $\geq 41$  years compared to younger adults.

There were greatest improvements in medium-term LDL cholesterol, short- and medium-term  $\dot{V}O_2\text{max}$ , and short-term systolic and diastolic blood pressure among older adults ( $\geq 41$  years) with elevated cardio-metabolic risk or cardio-metabolic disease ( $n = 42$ ) after medium-term interventions, compared to healthy older adults. For example, the largest reduction in systolic blood pressure following medium-term RET interventions was observed in older adults  $\geq 41$  years with elevated cardio-metabolic risk or disease ( $-8.80$  [ $-9.90$ ,  $-7.69$ ] mmHg,  $P < 0.00001$ ) compared to the healthy older adults ( $-4.36$  [ $-5.73$ ,  $-2.99$ ] mmHg,  $P < 0.00001$ ).

## Adverse events

One hundred and twenty-three RCTs (71%) did not report the occurrence of adverse events. Fifty studies (29%) reported information on adverse events and 17 of these reported that no adverse events occurred. Of the 50 studies reporting adverse events, 16 studies reported more than one adverse event occurring. Musculoskeletal injuries (e.g. lower back pain, knee pain) as a result of the intervention were reported in 20 studies ( $n = 20/50$ ; 40%), with more than one adverse event being reported in 15 of the 20 studies. Two studies (4%) detailed discomfort and muscle soreness related to RET. Illness or injury unrelated to RET were reported in seven (14%) studies. Three

studies (6%) reported that participants suffered injuries but the details and whether they were related to the intervention, was unclear. Syncope, possibly related to the intervention, was reported in three studies (6%). Cardiac issues (e.g. myocardial infarction, angina) thought to be unrelated to the RET were reported in four (8%) studies. Respiratory problems, unrelated to the intervention, were reported in two (4%) and hypoglycaemia in a further two (4%) studies. Four studies (8%) identified participants who underwent elective surgery unrelated to the study. Five studies (10%) reported a newly diagnosed condition or change in medication. Other adverse events reported only once included death (car crash), cerebral stroke, abdominal hernia and deep vein thrombosis; these were not associated with RET. Personal or professional issues resulting in withdrawal from the programme were reported in 5 (10%) studies.

## **DISCUSSION**

Resistance exercise training had a positive impact on cardio-metabolic health, via improvements in resting blood pressure,  $\dot{V}O_2\text{max}$  and blood biomarkers of cardio-metabolic risk. These improvements were most convincing for medium-term (7-23 weeks) interventions, which is likely to reflect the higher volume of published studies compared to short- (< 6 weeks) and long-term ( $\geq 24$  weeks) intervention durations. Relatively few studies have primarily investigated the cardio-metabolic health benefits of RET in clinical populations, particularly those at elevated risk of cardiovascular events. There is limited evidence of adverse events associated with RET with only 12% of studies included in the review reporting musculoskeletal injuries. Other studies reported transient levels of muscle soreness following RET, which is common after unaccustomed muscular exercise [27-29]. Therefore, we suggest that RET is a safe exercise option for both healthy and clinical populations.

There was a positive effect of RET on systolic and diastolic blood pressure. The reductions observed are of similar magnitude to those after aerobic exercise interventions [30-33], and could suggest a dose-response relationship for interventions of varying durations. Furthermore, given that hypertension is a global cause of mortality [34], the pronounced effects of RET on blood pressure outcomes in

**Figure 3.** (A) Short-term, (B) medium-term, (C) long-term effects of resistance exercise training as standardised mean difference and 95% CI. SBP - systolic blood pressure, DBP - diastolic blood pressure, MAP - mean arterial pressure, VO<sub>2max</sub> - maximum oxygen consumption, FMD - flow mediated dilatation, HDL-Chol - high density lipoprotein cholesterol, LDL-Chol - low density lipoprotein cholesterol, HOMA-IR - insulin resistance, CRP - c-reactive protein.

older populations observed in our subgroup analyses suggest that RET could be an effective non-pharmacological strategy for the prevention and/or control of hypertension in older adults who are at elevated cardio-metabolic risk.

The effect of RET on mean arterial pressure and resting heart rate was not statistically significant. Although resting heart rate may be less sensitive to change after RET, the lack of effect on mean arterial pressure (particularly for medium-term studies) could be due to few studies reporting mean arterial pressure in comparison to systolic or diastolic blood pressure. Additionally, diastolic blood pressure has a greater influence on mean arterial pressure than systolic blood pressure and, due to the less pronounced effect of RET on diastolic blood pressure, this could have impacted upon the significance of mean arterial pressure.

Low cardiopulmonary fitness has an indirect effect on cardiovascular disease risk and is partially (40-60%) mediated by cardiovascular risk factors including hypertension, hypercholesterolemia, obesity and fasting glucose [35]. Therefore, the beneficial effects of RET on  $\dot{V}O_2\text{max}$  is important. Traditionally, RET has not been used to provide a stimulus for improving cardiopulmonary exercise capacity, however our findings suggest that RET may be a reasonable choice for improving this health outcome. Improvements in  $\dot{V}O_2\text{max}$  after RET were modest (short-term: 2.38 [0.76, 4.00] ml/kg/min; medium-term: 1.13 [0.50, 1.76] ml/kg/min; long-term: 1.23 [0.6, 1.87] ml/kg/min). However, larger effects were observed for older adults at elevated cardio-metabolic risk. This is clinically important since it suggests that RET may contribute to reducing the risk of cardiovascular morbidity and mortality in high risk populations [36]. On the other hand, it is also possible that those who participated in RET also increased their participation in aerobic activity. Exercise training outside of RET interventions was generally not monitored and may account for some of the change in  $\dot{V}O_2\text{max}$  after RET.

Endothelial dysfunction is associated with cardiovascular disease and the ageing process. Endothelial dysfunction is linked to a decrease in nitric oxide availability, which can be improved through exercise [37]. A deterioration in flow-mediated dilatation of approximately 1% is associated with a 13% increased risk of future cardiovascular events [38, 39]. We found improvements in endothelial function (flow-mediated dilatation) with RET programmes that lasted 7-23 weeks. This is likely to

result from shear stress-induced adaptations in nitric oxide metabolism resulting from muscular contractions, resting heart rate and blood pressure changes during RET [26]. Shear-stress induced adaptations may not be restricted to blood vessels within the active skeletal muscles, as exercise programmes that are performed predominantly with the legs induce improvements in brachial artery flow-mediated dilatation [40]. Therefore, RET may be an effective stimulus for improving flow-mediated dilatation, potentially reducing the risk of cardio-metabolic disease.

The most favourable changes in blood biomarkers were apparent in short- and medium-term studies in the pooled analysis. The lower number of longer-term studies may have reduced the level of statistical power required to detect significant changes. We found greater reductions in low-density lipoprotein cholesterol, triglycerides and fasted glucose among older adults. There were also significant reductions in C-reactive protein after short- and medium-term RET among older adults at elevated cardio-metabolic risk (Table 4 and Supplementary Table 7). Reductions in C-reactive protein, fasted glucose and insulin, and HOMA-IR could have been mediated by the effect of RET on body composition, including an increase in skeletal muscle mass and reduction in fat mass, and the resulting impact on adipokine secretion [15, 41], insulin sensitivity [42] and glucose transport [43, 44]. These improvements in metabolic functioning following RET could have important clinical implications for the prevention and treatment of metabolic syndrome, type 2 diabetes mellitus and cardiovascular disease [41, 32, 45, 46].

Future studies on RET interventions should monitor or control for the potential confounding influence of aerobic exercise outside of the intervention. It is unclear whether improvements in  $\dot{V}O_2\text{max}$  after RET are more attributable to the cardiopulmonary stimulus of RET leading to improved oxygen transport (via increased cardiac stroke volume) or metabolic adaptations resulting in improved utilisation of oxygen at the level of skeletal muscle. Improvements in  $\dot{V}O_2\text{max}$  following medium- to long-term programmes of aerobic exercise training tend to be greater and mainly reflect an increase in cardiac stroke volume in previously untrained individuals [47, 48]. The relative importance of, and potential to maximise central, systemic and peripheral adaptations, by altering the characteristics of RET (e.g. sets, repetitions, rest etc.) warrants further research. Furthermore, additional high-quality research is also required to formulate the optimal design of a RET programme to promote

cardiovascular health and risk factor management in middle-aged and clinical populations.

## **Limitations**

The main findings of this systematic review need to be considered in the context of some key limitations, including restricting the search to two electronic databases, language bias and unexplained statistical heterogeneity for some of the analyses. Publication bias was also evident, and is probably attributable to inadequate data analysis, poor methodological quality and/or varying sample sizes of included studies. It is unlikely that selective outcome reporting influenced the funnel plots as 90.6% of the studies were rated as low risk for this outcome. Additionally, poor methodological quality of some of the included studies could have affected the estimates of the outcomes. Although all the included studies were RCTs, few studies adequately reported the randomisation process ( $n = 36$ ), allocation concealment ( $n = 14$ ), or blinding of outcome assessment ( $n = 27$ ). Therefore, many studies were rated as unclear bias in multiple categories and this may have contributed to the lack of reduction in heterogeneity in the sensitivity analyses. Additionally, some data were not pooled due to lack of access to the mean (SD) scores.

Reporting must improve, as many studies had incomplete descriptions of RET programmes and progression, small sample sizes, inadequate documentation of adherence and lacked detail regarding the timing of blood sampling in relation to the last bout of exercise (potentially influencing circulating levels of blood biomarkers). Improved reporting of trials may also improve the quality of evidence, as all outcomes in this review were graded as either very low or low quality, and higher-quality reporting of outcomes may alter the effect estimates. Authors should follow guidelines when reporting trials such as the TIDieR checklist and guide [49].

Studies of varying duration are needed, as the majority included in our systematic review involved medium-term interventions. In addition, data analyses were often based only on participants who successfully completed the training intervention, rather than applying an intention to treat analysis. This could have altered the study results [23, 50]. Finally, cardiorespiratory fitness levels of participants prior to a RET intervention is likely to influence training-induced adaptations and this should be considered in future research.

## **CONCLUSION**

RET was a safe and effective exercise modality for inducing improvements in resting blood pressure, flow-mediated dilatation, blood biomarkers of cardio-metabolic risk and cardiopulmonary fitness in adults. The effects were more pronounced in older adults ( $\geq 41$  years) and those with elevated cardio-metabolic risk or disease.

## SUMMARY

### WHAT ARE THE NEW FINDINGS?

- The results suggest that RET improves several cardiometabolic risk factors; however, the quality of the evidence was low and there were no data on hard clinical end-points.
- Improvements in cardiometabolic risk factors were more pronounced in individuals with elevated cardiometabolic risk or disease when compared with younger healthy adults.
- Few adverse events were reported, suggesting that RET is safe.

**Table 2.** Study characteristics

Author & year	Country	Population	Duration & frequency	Intervention	Timing of outcomes	Funding & conflicts of interest
Ades et al. 1996	USA	RT = 69.9 ± 4 yrs CON = 70.7 ± 5 yrs Male and female Healthy elderly	12 weeks 3 d per week	Supervision not reported Free weights and weight machines 3 sets of 8 reps at 50% 1RM with progression to 80% by week 9	Baseline and 12 weeks	Grants from National Institute of Health and General Clinical Research Centres.
Afshar et al. 2010	Iran	RT = 51 ± 16.4 yrs AT = 50.7 ± 21.1 yrs CON = 53 ± 19.4 yrs Males Haemodialysis	8 weeks	Supervised by a physician Ankle weights 2 sets of 8 reps progressed to 3 sets	Baseline and 8 weeks	
Ahmadizad et al. 2007	Iran	RT = 40.9 ± 3.2 yrs AT = 41.3 ± 5.1 yrs CON = 38.6 ± 3.2 yrs Male Sedentary obese	12 weeks 3 d per week	Supervision not reported Circuit resistance training 4 sets of 12 maximal reps at 11 stations 50–60% of 1RM in each station	Baseline and 12 weeks	Tarbiat Moallem University of Sabzevar in Iran.
Ahmadizad et al. 2014	Iran	Total cohort 23.4 ± 0.6 yrs Male Sedentary overweight	8 weeks 3 d per week	Supervised Free weights, weight machines and body weight 1-2 weeks: 1 set of 10 reps 3-8 weeks: 2–3 sets of 20–30 reps NP: constant moderate intensity DUP: rotated loading LP: volume was decreased and the training intensity was increased each week	Baseline and 8 weeks	
Almenning et al. 2015	Norway	Total cohort 27.2 ± 5.5 yrs Females Polycystic ovary syndrome	10 weeks 3 d per week	Supervised by an exercise physiologist at least 1 session a week 3 sets of 10 reps at 75% 1RM	Baseline and 10 weeks	The Norwegian Fund for Research in Sports Medicine.
Anderson et al. 2004	USA	RT = 26.4 ± 7.5 yrs AT = 20.9 ± 2.4 yrs CON = 26.6 ± 6.5 yrs Males Healthy sedentary	6 weeks 3 d per week	Supervision not reported Free-weight and machine exercises 2 sets of 10-15 reps	Baseline and 6 weeks	
Andersen et al. 2008	Denmark	RT = 44 ± 9 yrs Fitness Training = 45 ± 9 yrs CON = 42 ± 8 yrs Females Trapezius myalgia	10 weeks 3 d per week	Supervised Free-weight and machine exercises 3 sets Intensity progressively increased from 12RM to 8RM	Baseline and 10 weeks	Grants from Danish Medical Research Council and the Danish Rheumatism Association.
Andersen et al. 2014	Denmark	Total cohort = 68.2 ± 3.2 yrs Males Healthy elderly	16 weeks 2 d per week	Supervised Free-weight and machine exercises 0-4 weeks: 3 sets of 16-20 reps 5-8 weeks: 3 sets of 12 reps	Baseline and 16 weeks	Supported by the FIFA Medical Assessment and Research Centre, The Danish Ministry of

				9-12 weeks: 3 sets of 10 reps 13–16 weeks: 4 sets of 8 reps		Culture, and Nordea-fonden, Denmark.
Andersen et al. 2016	USA	Total cohort = 68.1 ± 2.1 yrs Healthy elderly	36 weeks 2 d per week	Supervised Free weight, weight machines and body weight 0-4 weeks: 3 sets of 16–20RM 5-8 weeks: 3 sets of 12RM 9-12 week: 3 sets of 10RM 13-52 weeks: 4 sets of 8RM	Baseline and 36 weeks	Supported by the FIFA-Medical Assessment and Research Centre (Project 31964). The Danish Ministry of Culture (Kulturministeriets Udvalg for Idrætsforskning) (TKIF 2010-027), and Nordea-fonden (02-2011-4360).
Arora et al. 2009	India	RT = 49.6 ± 5.2 yrs AT = 52.2 ± 9.3 yrs CON = 58.4 ± 1.8 yrs Male and female Type 2 diabetes	8 weeks 2 d per week	Supervised 3 sets of 10 reps at 60-100% 1RM	Baseline and 8 weeks	Grant from University Grants Commission, Delhi, India.
Asad et al. 2012	Iran	RT = 21 ± 1.6 yrs AT = 22 ± 0.9 yrs Concurrent = 21.4 ± 2.1 yrs CON = 21.4 ± 1.1 yrs Male Healthy sedentary	8 weeks 3 d per week	Supervision not reported Free weights and weight machines 3 sets of 10-15 reps Weeks 2-8: first set for 10-12 reps, 8-10 reps for second set and 4-8 reps for third set	Baseline and 8 weeks	
Augusto Libardi et al. 2012	Brazil	RT males = 47 ± 4.5 yrs RT females = 53.7 ± 3.7 yrs CON males = 49.5 ± 5.6 yrs CON females = 51.2 ± 6.4 yrs Males and females Healthy sedentary	16 weeks 3 d per week	Supervision not reported Free-weight, machine exercises and body weight 3 sets of 10 reps 9-16 weeks: 8 reps	Baseline and 16 weeks	Supported by Conselho Nacional de Desenvolvimento Científico e Tecnológico
Azərbayjani et al. 2014	Iran	RT = 23.1 ± 1.4 yrs AT = 23.3 ± 1.3 yrs Concurrent = 22.9 ± 1.7 yrs CON = 22.9 ± 1.7 yrs Males Healthy sedentary	12 weeks 3 d per week	Supervision not reported Free-weight and machine exercises 3 sets of 10 reps at 70% 1RM	Baseline and 12 weeks	Grant (90084702) from the Islamic Azad University, Central Tehran Branch grants commission.
Badrov et al. 2013	Canada	IHG3 = 23 ± 4 yrs IHG5 = 27 ± 6 yrs CON = 24 ± 8 yrs Females Healthy sedentary	8 weeks IHG3 - every other day IHG5 - five consecutive days	Supervision for 2 sessions a week Isometric hand grip at 30% MVC	Baseline, 4 and 8 weeks	Supported by the University of Windsor (810043; 809264; 808316; CLM), the Canadian Institutes of Health Research, Heart and Stroke/Richard Lewar Centre of Excellence Postdoctoral Fellowship, and an Ontario Graduate Scholarship.
Baldi & Snowling 2013	New Zealand	RT = 46.5 ± 2.1 yrs CON = 50.1 ± 1.3 yrs Females	10 weeks 3 d per week	Supervised 1-2 circuits of 12 reps at 10RM (upper body) or 15RM (lower body)	Baseline and 10 weeks	

		Type 2 diabetes				
DeBarros et al. 2010	Brazil	RT = $31.8 \pm 4.9$ yrs CON = $32.4 \pm 5.4$ yrs Female Type 2 diabetes	24-34 weeks 3 d per week	Supervised by the researcher for 1 session a week Elastic resistance band circuit Exercise intensity was controlled using a perceived exertion scale. Subjects advised to maintain an exercise intensity close to 5 or 6, which corresponds to a “somewhat heavy”.	Baseline and 24 weeks	Supported by Coordenação de Aperfeiçoamento de Pessoal de Nível Superior with master's fellowship grant.
Beck et al. 2013 <i>Beck et al. 2013</i>	USA	RT = $21.1 \pm 2.5$ yrs AT = $20.1 \pm 1.1$ yrs CON = $21.6 \pm 2.9$ yrs Normotensive CON = $21.6 \pm 2.7$ yrs Male and female young Pre-hypertensives  RT = $21.1 \pm 0.6$ yrs AT = $20.1 \pm 0.9$ yrs CON = $21.6 \pm 0.8$ yrs Normotensive CON = $21.6 \pm 0.7$ yrs Male and female Pre-hypertensives	8 weeks 3 d per week	Supervision not reported Weight machines 2 sets of 8–12 reps to volitional fatigue  <i>Weight machines</i> <i>2 sets of 8–12 reps to volitional fatigue</i>	Baseline and 8 weeks	Supported, in part, by a National Institutes of Health pre-doctoral training grant (NIH 5-T32-HL083810-04) awarded by the University of Florida Hypertension Centre.  <i>Supported, in part, by a National Institutes of Health predoctoral training grant (NIH 5-T32-HL083810-04) awarded to D.T.B. by the University of Florida Hypertension Centre.</i>
Bell et al. 2000	Canada	Total cohort = $22.3 \pm 3.3$ yrs Male and female Physically active	12 weeks 3 d per week	Supervision not reported Free-weight and machine exercises 2-6 sets of 4-12 reps	Baseline, 6 and 12 weeks	
Beltran Valls et al. 2014	Italy	RT = $72 \pm 1$ yrs CON = $72 \pm 1$ yrs Male and female Healthy elderly	12 weeks 2 d per week	Supervised Weight machines 1-2 weeks: 4 sets of 15 reps at 40–50 % 1RM 3-12 weeks: 3–4 sets of 10–12 reps at 70 % of baseline 1RM	Baseline and 12 weeks	Grants from the University of Rome “Foro Italico” (Research 2009) to D. C. The Lazio Regional Municipality (Agreement CRUL-Lazio n. 12650/2010) supported the post-doc scholarship to ID.
Bertuzzi et al. 2013	Brazil	RT = $31 \pm 5$ yrs RT with WBV = $34 \pm 6$ yrs CON = $33 \pm 7$ yrs Sex not reported. Long-distance runners	6 weeks 2 d per week	Supervised Weight machines 1–2 weeks: 3 sets at 8-10RM 3–4 weeks: 4 sets at 6-8RM 5–6 weeks: 6 sets at 4–6RM	Baseline and 6 weeks	Post-doctoral grant São Paulo Research Foundation (FAPESP: 08-50934-1) and master scholarships from São Paulo Research Foundation (FAPESP: 2010/13913-6 and 2011/02769-4, respectively).
Bishop & Jenkins 1996	Australia	Only report cohort was 17-24 yrs Males	6 weeks 3–4 d per week	Supervised Weight machines 3-6 sets of 1-3 or 12-15 reps	Baseline and 6 weeks	

		Physically active				
Bishop et al. 1999	Australia	Only report cohort was 18-42 yrs Female Cyclists	12 weeks 2 d per week	Supervised Weight machines 5 sets to failure at 2-8RM	Baseline, 6 and 12 weeks	
Boardley et al. 2007	USA	RT = $74.1 \pm 6.2$ yrs Combined = $75.3 \pm 6$ yrs AT = $73.2 \pm 6.6$ yrs CON = $75.9 \pm 7.7$ yrs Male and female Healthy elderly	16 weeks 3 d per week	Supervised by project staff for 2 sessions a week Elastic resistance bands 1-2 weeks: 1 set of 10 reps 3-16 weeks: 2 sets of 12 reps Theraband colour was changed so that it provided sufficient resistance to produce mild fatigue at the final rep	Baseline, 8 and 16 weeks	Funded by the National Institute for Nursing Research grant #R01 NR04929. The Hygenic Corporation supplied the Thera-Band but had no other role in the study.
Borges & Carvalho 2014	Brazil	RT = $64.1 \pm 12.5$ yrs CON = $67.8 \pm 9$ yrs Male and female COPD	Completed a minimum of 3 sessions	Supervised Free weights and weight machines 2 sets of 9 reps Initial load was 80% 1RM and adjusted in subsequent sessions based on symptoms, Borg Dyspnea Scale scores, and patient fatigue	Evaluated on the second day in hospital, at discharge, and 30 days post discharge	
Brentano et al. 2008	Brazil	Age not reported Female Post-menopausal	24 weeks 3 d per week	Supervision not reported Free-weight and machine exercises RT circuit: 2-3 sets of 10-20 reps at 45-60% 1RM RT: 2-4 sets of 6-20 reps at 45-80% 1RM	Baseline, 8, 16 and 24 weeks	
Brito et al. 2013	Brazil	Age not reported. Male and female HIV/AIDS	24 weeks. 3 d per week	Supervised Free-weight and machine exercises 3 sets of 8-10 reps at 80% 1RM	Baseline and 24 weeks	
Broeder et al. 1992	USA	Only report cohort 18-35 years Males Physically active	12 weeks 4 d per week	Supervised Free-weight and machine exercises 1-2 weeks: 10-12 reps 3-12 weeks: 10-12 reps on the first set, 8-10 reps on the second set, and 6-8 reps on the third set	Baseline and 12 weeks	
Brooks et al. 2007	USA	RT = $66 \pm 2$ yrs CON = $66 \pm 1$ yrs Males and females Type 2 diabetes	16 weeks 3 d per week	Supervision not reported Weight machines 3 sets of 8 reps 1-9 weeks: 60% 1RM 10-14 weeks: 70-80% 1RM	Baseline and 16 weeks	Funded, in part, by the Brookdale Foundation, the USDA ARS agreement 58-1950-9-001, the NIH General Clinical Research Center M01 RR000054, and the International Life Sciences Institute North America.

Buchner et al. 1997	USA	RT = 74 yrs AT = 75 yrs AT + RT = 75 yrs CON = 75 yrs Male and female Healthy elderly	24-26 weeks 3 d per week	Supervised Weight machines 2 sets of 10 reps with the first set at 50-60% 1RM and the second set 75% 1RM	Baseline and 24 weeks Follow up at 28 weeks	Grants from the National Institute on Aging (U01 AG09095), Centres for Disease Control and Prevention (R48 CCR002181), and the Department of Veterans Affairs.
Camargo et al. 2008	Brazil	RT = 29 ± 3 yrs AT = 29 ± 4 yrs CON = 30 ± 4 yrs Males Healthy sedentary	12 weeks 3 d per week	Supervised Weight machines 3 sets of 15 reps at 60% of 1RM	Baseline and 12 weeks	Partially supported by a grant from FIPE-Hospital de Clinicas de Porto Alegre and FAPICC.
Castaneda et al. 2002	USA	RT = 66 ± 2 yrs CON = 66 ± 1 yrs Male and female Type 2 diabetes	16 weeks 3 d per week	Supervision not reported 3 sets of 8 reps Weight machines 1-8 weeks: 60-80% of baseline 1RM 10-14 weeks: 70-80% of mid-study 1RM	Baseline and 16 weeks	Funded, in part, by Brookdale foundation in U.S. Department of Agriculture, the National Institutes of Health Clinical Research Centre and the International Life Sciences Institute, North America.
Christensen et al. 2014	Denmark	RT = 34.4 ± 7.6 yrs CON = 35.8 ± 8.9 yrs Male Disseminated germ cell cancer	9 weeks 3 d per week	Supervised 1-2 weeks: 3 sets of 15 reps at 15RM 3-9 weeks: 4 sets of 10 reps at 10-12RM	Baseline and 9 weeks	Supported by Copenhagen University Hospital, the Beckett Foundation and the Centre for Integrated Rehabilitation of Cancer Patients.
Colado et al. 2009	Spain	RT = 54 ± 2.8 yrs Aquatic = 54.7 ± 2 yrs CON = 52.9 ± 1.9 yrs Female Post-menopausal	24 weeks	Supervised Free-weight, machine and body weight exercises 1-12 weeks: 8 exercise circuit, 1 set of 20 reps with 30 sec active rest between sets, 1 set upper body, 2 sets lower body. 12-24 weeks: 10 exercise circuit, 1 set of 20 reps	Baseline and 24 weeks	Funding (PMAFI-PI-01/1C/04) from the Research Funds Program of the Catholic University San Antonio in Murcia (Spain).
Conceição et al. 2013	Brazil	RT = 53.4 ± 4 yrs CON = 53 ± 5.7 yrs Females Post-menopausal	16 weeks 3 d per week	Supervision not reported Free-weight, machine and body weight exercises 1-8 weeks: 3 sets of 10 reps at 10RM with 60 s rest between sets 9-16 weeks: 3 sets of 8 reps at 8RM with 90 s rest between sets	Baseline and 16 weeks	Funding from the São Paulo Research Foundation (FAPESP) for financial support (2012/09709-0).
Courneya et al. 2007 <i>Courneya et al. 2010</i>	Canada	RT = 49.5 yrs AT = 49 yrs Control = 49 yrs Females Breast cancer	18 weeks <i>Not reported</i>	Supervised Weight machines 2 sets of 8-12 reps at 60% to 70% 1RM	Baseline, 9 (only for subjective measures) and 18 weeks	None reported  <i>Grant from the Canadian Breast Cancer Research Alliance. Also supported by a Doctoral Research Award from the Canadian Institutes of Health</i>

						Research, the Canada Research Chairs Program, a Research Team Grant from the National Cancer Institute of Canada with funds from the Canadian Cancer Society and the National Cancer Institute of Canada Canadian Cancer Society Socio-behavioural Cancer Research Network and a New Investigator Award from the Heart and Stroke Foundation of Canada.
Croymans et al. 2013	USA	RT = 21.5 yrs Control = 22 yrs Male Sedentary obese	12 weeks 3 d per week	Supervised Free-weight, machine and body weight exercises 1-2 weeks: 2 sets of 12–15 reps at 100% of estimated 12–15RM 3–7 weeks: 3 sets of 8–12 reps, at 100% of 8–12RM 8–12: weeks: 6–8 reps at 6–8RM	Baseline and 12 weeks	Supported by the American Heart Association (BGIA no 0765139Y to CKR), the National Heart, Lung and Blood Institute (P50 HL105188 to CKR) and the National Centre for Advancing Translational Sciences through UCLA CTSI Grant UL1TR000124 RAH and the American Heart Association (10SDG305006).
Davidson et al. 2009	USA	FEMALES: RT = 67.6 ± 4.2 yrs AT = 69.1 ± 6.5 yrs Combined = 66.5 ± 5.3 yrs CON = 66.7 ± 3.7 yrs MALES: RT = 67.4 ± 6 yrs AT = 68.8 ± 6 yrs Combined = 67.1 ± 5 yrs CON = 67.4 ± 3.8 yrs Male and female Sedentary obese	24 weeks 3 d per week	Supervision not reported Free-weight, machine and body weight exercises 1 set Each exercise was performed until volitional fatigue	Baseline and 24 weeks	Supported by research grant MT 13448 from the Canadian Institutes of Health Research.
DeLima et al. 2012	Brazil	RT linear periodization = 25.2 ± 4.4 yrs RT undulating periodization = 27.4 ± 2.8 yrs CON = 23.4 ± 1.3 yrs Female Healthy sedentary	12 weeks 3 d per week	Supervised Free-weight, machine and body weight exercises 3 sets until failure RT linear: 3 sets of 30RM, in the second week 3 sets of 25RM, in the third week 3 sets of 20RM and in the fourth week 3 sets of 15RM RT undulating: weeks 1, 3, 5, 7, 9 and 11, participants trained on days 1 and 2 with 3	Baseline and 12 weeks	

				sets of 30RM and on days 3 and 4 with 3 sets of 25RM. Weeks 2, 4, 6, 8, 10 and 12, participants trained on days 1 and 2 with 3 sets of 20RM and on days 3 and 4 with 3 sets of 15RM.		
DeSouza et al. 2014	Brazil	RT = $25.9 \pm 6.4$ yrs Interval = $24 \pm 7.5$ yrs Concurrent = $22.5 \pm 3.9$ yrs CON = $22.1 \pm 2.4$ yrs Male Physically active	8 weeks 2 d per week	Supervision not reported 3-5 sets of 6-12RM	Baseline and 8 weeks	
Deibert et al. 2011	Germany	RT = $55.5 \pm 4.8$ yrs RT + supplement = $55.9 \pm 3.5$ yrs CON = $55.8 \pm 5.5$ yrs Male Healthy sedentary	12 weeks 2 d per week	Supervised Weight machines 1-4 weeks: 25 reps 5-9 weeks: 15 reps 10-12 weeks: 10 reps	Baseline and 12 weeks	Grants from Almased Wellness Corp.
DeVallance et al. 2016	USA	RT = $51 \pm 3$ yrs CON = $44 \pm 3$ yrs Male and female Metabolic syndrome	8 weeks 3 d per week	Supervision not reported Weight machines 3 sets of 8-12 reps 1-2 weeks: 60% of 1RM 3-4 weeks: 70% of 1RM 5-6 weeks: 80% of 1RM 7-8 weeks: 85% of 1RM	Baseline and 8 weeks	Supported in part by the American Heart Association Grant 11CRP7370056, National Heart, Lung, and Blood Institute Grant T32-HL-090610, and National Institute of General Medical Sciences of the National Institutes of Health under Award U54-GM-104942 and 1P20 GM109098, STEM Mountains of Excellence Fellowship.
Donges et al. 2010	Australia	Age not reported. Male and female Healthy sedentary	10 weeks 3 d per week	Supervised Weight machine exercises 10RM that is reported to approximate with 75% of a 1RM	Baseline and 10 weeks	Funded by Charles Sturt University.
Dunstan et al. 1998	Australia	RT Circuit = $50.3 \pm 7.7$ yrs CON = $51.1 \pm 7.6$ yrs Male and female Type 2 diabetes	8 weeks 3 d per week	Supervised Free-weight, machine and body weight exercises 1-2 weeks: 2 sets of 10-15 reps at 50-55% 1RM 3-8 weeks: 3 sets of 10-15 reps at 50-55% 1RM	Baseline and 8 weeks	Supported by a National Health and Medical Research Council program grant 'Studies in hypertension and vascular disease'.
Edge et al. 2006	Australia	Total cohort = $18 \pm 1$ yrs Female Physically active	5 weeks	Supervision not reported Free weights and machines 1-2 weeks: 2-3 sets of 15-20 reps 3-5 weeks: 3-5 sets of 15-20 reps Set 1 at 70% 3RM; set 2 at 60% 3RM; sets 3-5 at 50% 3RM	Baseline and 5 weeks	

Egana et al. 2010	Ireland	RT = 69 ± 5 yrs CON = 64 ± 4 yrs Female Healthy elderly	12 weeks 2 d per week	Supervised Therabands 2 sets at 100% 10RM	Baseline and 12 weeks	
Elliott et al. 2002	UK	RT = 58 ± 4 yrs CON = 53 ± 3 yrs Female Post-menopausal	8 weeks 3 d per week	Supervision not reported 3 sets of 8 reps at 80% 10RM	Baseline and 8 weeks Follow-up at 16 weeks	
Fahlman et al. 2002	USA	RT = 73 ± 3 yrs AT = 76 ± 5 yrs CON = 74 ± 5 yrs Female Healthy elderly	10 weeks 3 d per week	Supervision not reported Weight machines 3 sets of 8 reps at 8RM	Baseline and 10 weeks	
Fatouros et al. 2005	Greece	RT low intensity = 71.1 ± 3.6 yrs RT mod intensity = 69.7 ± 3.8 yrs RT high intensity = 70.8 ± 2.8 yrs CON = 69.8 ± 5.1 yrs Male Sedentary obese	24 weeks 3 d per week	Supervised Weight machines and body weight RT low intensity – 1-8 weeks: 2 sets, 9-24 weeks: 3 sets, 45-50% 1RM RT mod intensity – 1-8 weeks: 2 sets, 9-24 weeks: 3 sets, 60-65% 1RM RT high intensity – 1-8 weeks: 2 sets, 9-24 weeks: 3 sets, 80-85% 1RM	Baseline and 24 weeks Follow up at 48 weeks	
Fenkci et al. 2006	Turkey	RT = 44 ± 10.2 yrs AT = 41.7 ± 6.9 yrs CON = 43.8 ± 7.4 yrs Female Sedentary obese	12 weeks 3 d per week	Supervision not reported Weight machines 1 week: 1 set of 10 reps of 40-60% 1RM 2 weeks: 2 sets of 10 reps of 40-60% 1RM 3 weeks: 3 sets of 10 reps of 40-60% 1RM 4-12 weeks: 3 sets of 75-80% 1RM	Baseline and 12 weeks	
Figueroa et al. 2012  Figueroa et al. 2013  Figueroa et al. 2013	USA	Not reported.  <i>RT with WBV = 56 ± 3 yrs</i> <i>CON = 56 ± 3 yrs</i>  <i>RT with WBV = 55.5 ± 0.7 yrs</i> <i>CON = 56.4 ± 1 yrs</i> Female Sedentary obese	6 weeks 12 weeks 3 d per week	Supervised Whole body vibration with free weights Vibration intensity was progressed by increasing the frequency (25–30Hz) and amplitude (1–2mm). The duration of the sets and rest periods was progressively increased (30–60 s) and decreased (60–30 s), respectively.	Baseline and 6 weeks	
Franklin et al. 2015	USA	RT = 30.3 ± 5.4 yrs CON = 30.8 ± 9.0 yrs Female Sedentary obese	8 weeks 2 d per week	Supervised Free weights and machines 2-3 sets of 10 reps at 80–90% 10RM	Baseline and 8 weeks	Supported by the National Heart, Lung, and Blood Institute grants IK23HL85614, RO1HL095701, and HL095701-01A2S, and the University of

						Illinois at Chicago, Centre for Clinical and Translational Science, award UL1RR029879 from the National Centre for Research Resources.
Garcia-Lopez et al. 2007	Finland	RT = 54.9 ± 1.9 yrs AT = 53.6 ± 2.4 yrs CON = 53.3 ± 2.5 yrs Male Healthy sedentary	21 weeks 2 d per week	Supervised Weight machines 1-7 weeks: 2-4 sets of 8-15 reps at 40–70% 1RM 8–14 weeks: 2-5 sets of 5-12 reps at 60–80% 1RM 15-21 weeks: 3-5 sets of 5-10 reps at 60–85% 1RM	Baseline, 10.5 (not control group) and 21 weeks	Funded, in part, by a grant from the Ministry of Education, Finland.
Gater et al. 1992	USA	Physically active	10 weeks	Not reported	Baseline and 10 weeks	Grant from Ross Laboratories, the Achievement Reward for College Scientists Foundation, and National Heart, Lung and Blood Institute Research Services Award HL-07249.
Gelecek et al. 2012	Turkey	RT = 54.3 ± 5.3 yrs CON = 51.8 ± 3.7 yrs Female Post-menopausal	12 weeks 3 d per week	Supervised Free weights and machines 2 sets of 8-12 reps at 60% 1RM	Baseline and 12 weeks	Funded by the Department of Scientific Research Projects of Dokuz Eylül University.
Gettman et al. 1978	USA	Physically active	20 weeks 3 d per week	Supervision not reported Free weight, weight machines and body weight 1-6 weeks: 10-20 reps per set at 50% 1RM 7-20 weeks: 15 reps per set at 50% 1RM	Baseline and 20 weeks	Supported by the International Association of Chiefs of Police/Law Enforcement Assistance Administration, Grant No. 76-NI-99-001
Gordon et al. 2006	UK	RT = 67 ± 2 yrs CON = 67 ± 2 yrs Male and female Type 2 diabetes	16 weeks 3 d per week	Supervision not reported Weight machines 3 sets of 8 reps at 60-65% 1RM	Baseline and 16 weeks	Supported by the Brookdale Foundation, USDA ARS Cooperative Agreement 58-1950-9-00 I and NIH GCRC grant MOI RR000054.
Greenwood et al. 2015	USA	RT = 54.6 ± 10.6 yrs AT = 53.9 ± 10.7 yrs CON = 49.5 ± 10.6 yrs Male and female Kidney transplant recipients	12 weeks 3 d per week	Supervised Elastic resistance bands, ankle weights and free weights 1-2 sets of 10 reps at 80% 1RM	Baseline and 12 weeks	Funded by an NIHR Doctoral Research Fellowship. The study was hosted in the King's College Hospital NIHR clinical research facility. This article presents independent research funded by the NIHR.
Gregory et al. 2013	USA	Total cohort = 20.3 ± 0.3 yrs Female Physically active	8 weeks 3 d per week	Supervised Free-weight, machine and body weight exercises 3 sets of 3-12RM	Baseline, 4 and 8 weeks	Grant from the U.S. Army Medical Research and Materiel Command Bone Health and Military Medical Readiness Research Program to BCN.

Hagberg et al. 1989	USA	Total cohort = $72 \pm 3$ yrs Male and female Healthy sedentary	26 weeks 3 d per week	Supervised Weight machines 8-12 reps	Baseline, 13 (not controls and 26 weeks)	Funded, in part, by a grant from the Diabetes Treatment Centres of America Foundation.
Hagerman et al. 2000	UK	RT = $63.7 \pm 5$ yrs CON = $66.2 \pm 6.5$ yrs Male Healthy elderly	16 weeks 2 d per week	Supervision not reported Free-weight, machine and body weight exercises 1 set of 10 reps at 85-90% 1RM followed by 3 sets to failure of 6-8 reps at 85-90% 1RM	Baseline and 16 weeks	
Hagstrom et al. 2016	Australia	RT - $51.2 \pm 8.5$ yrs CON - $52.7 \pm 9.4$ yrs Female Breast cancer	16 weeks 3 d per week	Supervised Free weight and weight machines 3 sets of 8-10 reps at 8RM	Baseline and 16 weeks	Supported by a grant from Western Sydney University, Australia.
Hallsworth et al. 2011 <i>Jakovljevic et al.</i>	Finland	RT = $52 \pm 13.3$ yrs CON = $62 \pm 7.4$ yrs RT = $49 \pm 13$ yrs CON = $62 \pm 7$ yrs Male and female Non-alcoholic fatty liver disease	8 weeks 3 d per week	Supervision biweekly Free weights and weight machine 2 sets at 50% 1RM	Baseline and 8 weeks	
Hautala et al. 2006	Canada	RT = $42 \pm 1$ yrs CON = $41 \pm 1$ yrs Male and female Healthy sedentary	2 weeks 5 d per week	Supervised 1 set of 8-12 reps	Baseline and 2 weeks	Funding from the EU Seventh Framework Programme (FP7/2007-2013) under grant agreement no Health-F2-2009-241762, for the project FLIP; the MRC; the UK NIHR Biomedical Research Centre on Ageing and Age-Related Diseases and Diabetes UK.
Haykowsky et al. 2000	Canada	RT = $68 \pm 3$ yrs CON = $68 \pm 4$ yrs Male Healthy elderly	16 weeks 3 d per week	Supervision not reported Free weights and weight machine 3-10 reps at 60-80% 1RM	Baseline, 4, 8, 12 and 16 weeks	Grants from the Ministry of Education (Helsinki, Finland) and the Medical Council of the Academy of Finland (Helsinki, Finland).
Haykowsky et al. 2005	Iran	RT = $70 \pm 4$ yrs AT = $66 \pm 3$ yrs Combined = $68 \pm 6$ yrs CON = $67 \pm 4$ yrs Female Healthy elderly	12 weeks 3 d per week	Supervised 2 sets of 10 reps at 50% 1RM	Baseline and 12 weeks	
Hedayati et al. 2012	USA	RT 40% 1RM = $23.2 \pm 1$ yrs RT 80% 1RM = $21.9 \pm 1.5$ yrs CON = $20.8 \pm 1$ yrs	4 weeks 4 d per week	Supervision not reported Free weights and machines 3 sets of 8-11 reps	Baseline and 4 weeks	

		Female Physically active				
Heffernan et al. 2013	USA	RT = 60 ± 2 yrs CON = 63 ± 2 yrs Sex not reported. Pre-hypertensive and newly diagnosed/never-treated hypertensive	12 weeks 3 d per week	Supervised Weight machines 2 sets of 12-15 reps at 40% 1RM for upper body and 60% 1RM for lower body	Baseline and 12 weeks	
Hendrickson et al. 2010	USA	RT = 21 ± 0.5 yrs AT = 21 ± 0.4 yrs Combined = 20 ± 0.4 yrs CON = 20 ± 0.5 yrs Female Physically active	12 weeks 3 d per week	Supervised Free weights, machine and body weight exercises 3–6 weeks - “light” days at 12RM, “moderate” days at 8–10RM, and “heavy” days at 6–8RM loads. 8–11 weeks - “light” days at 12RM, “moderate” days at 6–8RM, and “heavy” days at 3–5RM	Baseline and 12 weeks	
Hiatt et al. 1994 <i>Hiatt et al. 1996</i>	Finland	RT = 67 ± 6 yrs AT = 67 ± 7 yrs CON = 67 ± 5 yrs Male Peripheral artery disease	12 weeks 4 d per week 3 d per week	Supervised Cuff weight secured to the leg 3 sets or 6RM	Baseline and 12 weeks	Funded, in part, by a grant from the Medical Research and Material Command Bone Health Research Program to BCN.
Hoff et al. 2007	Norway	RT = 62.8 ± 1.4 yrs CON = 60.6 ± 3.0 yrs Male and female Chronic obstructive pulmonary disease	8 weeks 3 d per week	Supervision not reported 4 sets of 5 reps at 85-90% 1RM	Baseline and 8 weeks	Grant H133G90114 from the National Institute on Disability and Rehabilitation Research. Dr Hiatt is the recipient of a National Institutes of Health Academic Award in Vascular Disease.
Holviala et al. 2012	Belgium	RT = 56.5 ± 7.6 yrs AT = 55.5 ± 8.7 yrs Combined = 56.9 ± 7.5 yrs CON = 56.7 ± 7.5 yrs Male Healthy sedentary	21 weeks 2 d per week	Supervised Weight machines 1-7 weeks - 40–60% of 1RM 8-14 weeks - 60–80% of 1RM 15-21 weeks - 70–85% of the 1RM	Baseline and 21 weeks	
Hoof et al. 1996	Canada	Age not reported. Male Healthy sedentary	16 weeks 3 d per week	Supervised Weight machines 1-4 weeks – 3 sets of 12 reps at 70%1RM 5-16 weeks - 3 sets of 10 reps at 70% 1RM followed by 4 reps at 90% 1RM	Baseline and 16 weeks	Funded, in part, by the Norwegian Research Council by providing a Professor II position for Dr Richardson, grant HL-17731 from the National Heart, Lung, and Blood Institute and Tobacco Related Disease Research Program grant #15RT-0100.

Horne et al. 1996	Finland	Total cohort = 22.3 ± 3.3 yrs Male and female Physically active	12 weeks 3 d per week	Supervision not reported Machines and free weights	Baseline, 6 and 12 weeks	Grants from the Belgian Ministry of Defence.
Hu et al. 2009	USA	RT = 32.2 ± 7.2 yrs CON = 31 ± 7.5 yrs Males Healthy sedentary	10 weeks 2-3 d per week	Supervised	Baseline and 10 weeks	
Huffman et al. 2014	Norway	Age not reported. Male and female Metabolic risk factors	24 weeks 3 d per week	Supervised Weight machines 3 sets of 8-12 reps	Baseline and 24 weeks	Grants from the National Technology Agency of Finland, the Ministry of Education of Finland, Juho Vainio Foundation and partially funded by the National Science Foundation of Guangdong Province (815100760100004), China.
Husby et al. 2009 <i>Husby et al. 2010</i>	USA	RT = 58 ± 5 yrs CON = 56 ± 8 yrs Male and female Total hip arthroplasty	4 weeks post-operative 5 d per week	Supervised Weight machines 4 sets of 5 reps at 85% 1RM	Pre-operative, 1 week post-operative, 5 week Follow up at 24 and 52 weeks	Supported by the National Heart, Lung, and Blood Institute, National Institute on Aging and National Institute of Arthritis and Musculoskeletal and Skin Diseases.
Irving et al. 2015	Denmark	Young: RT = 25 ± 1 yrs AT = 25 ± 1 yrs CON = 26 ± 1 yrs Combined = 26 ± 1 yrs Old: RT = 70 ± 1 yrs AT = 70 ± 1 yrs CON = 71 ± 2 yrs Combined = 71 ± 2 yrs Male and female Healthy sedentary	8 weeks 4 d per week	Supervised 4 sets of 8–10 reps	Baseline and 8 weeks	Supported by National Institute of Health grant R01-AG09531, R01-DK41973, National Centre for Advancing Translational Science grants UL1-RR024150 and KL2-RR024151, CTSA Grant Number UL1- TR000135 from the National Centre for Advancing Translational Sciences a component of the National Institutes of Health.
Jay et al. 2011	Finland	RT = 44 ± 8 yrs CON = 43 ± 10 yrs Male and female Healthy sedentary	8 weeks 3 d per week	Supervised Kettlebells	Baseline and 8 weeks	Funded by The National Research Centre for the Working Environment.
Kaikkonen et al. 2000	Brazil	RT = 42.5 ± 7 yrs AT = 41.6 ± 6 yrs CON = 41.9 ± 7 yrs Male and female Healthy sedentary	12 weeks 3 d per week	No supervision provided Weight machines 3 circuits of 10 stations	Baseline and 12 weeks	

Kanegusuku et al. 2011	Finland	RT = 63 ± 1 yrs Power Training = 65 ± 1 yrs CON = 63 ± 1 yrs Male Healthy elderly	16 weeks 2 d per week	Supervision not reported Weight machines RT: 2 sets, 10 reps at 70% to 4 sets, 4-6 reps, 85-90% PT: 3 sets, 7 reps, 30% to 4 sets, 4-6 reps, 45-50%	Baseline and 16 weeks	Supported by FAPESP (#07/56653-1 and #07/00788-6), CNPq (#471600/2008-3), CAPES, and Head of the Psychopharmacology Incentive Fund Association.
Karavirta et al. 2009 <i>Karavirta et al. 2011</i>	Finland	RT = 56 ± 6 yrs AT = 54 ± 8 yrs Combined = 56 ± 7 yrs CON = 54 ± 8 yrs Male Healthy sedentary	21 weeks 2 d per week	Supervised Weight machines and body weight 1-7 weeks: 3 sets of 15-30 reps at 40–60% 1RM 8-14 weeks: 2-4 sets of 6-12 reps at 60–80% 1RM 15-21 weeks: 2-4 sets of 5-8 reps at 70–85% 1RM	Baseline, 10.5 and 21 weeks	Partially supported by grants from the Ministry of Education, Finland, Central Finland Health Care District, Jyväskylä, Finland, and Polar Electro Oy. <i>Partly supported by the Ministry of Education, Finland and the Juho Vainio Foundation, Finland.</i>
Karavirta et al. 2013	Japan	RT = 52 ± 8 yrs AT = 52 ± 7 yrs Combined = 49 ± 6 yrs CON = 52 ± 8 yrs Female Healthy sedentary	21 weeks 2 d per week	Supervised Weight machines and body weight 1-7 weeks: 3 sets of 12-20 reps at 40–60% 1RM 8-14 weeks: 2-4 sets of 5-12 reps at 60–80% 1RM 15-21 weeks: 2-4 sets of 5-8 reps at 70–85% 1RM	Baseline, 10.5 and 21 weeks	Partly supported by the grants from the Ministry of Education and Culture, Central Finland Health Care District, Juho Vainio Foundation, Yrjo Jahnsson Foundation, the University of Jyväskylä, G. Harold and Leila Y. Mathers Charitable Foundation, James S. McDonnell Foundation, the National Institutes of Health-sponsored Research Resource for Complex Physiologic Signals, and the National Institute on Aging.
Karelis et al. 2015	Canada	RT - 45. 3± 14 yrs CON - 39.4 ± 8 yrs Male and female Kidney transplant patients	16 weeks 3 d per week	Supervised for 1 session a week Free weight, weight machines, body weight and elastic resistance 3 sets of 10 reps at 80% 1RM	Baseline and 16 weeks	Supported by funds from investigator-sponsored research by AstellasPharma Canada, Inc (SG112). RRL is supported by the Fonds de Recherche du Québec - Santé and holds the J-A De Sève research chair. MJH is supported by the Canadian Institutes of Health Research and Canadian National Transplant Research Program and holds the Shire chair in nephrology and renal transplantation and regeneration at the Université de Montréal.

Kawano et al. 2006	Canada	RT = 20 ± 1 yrs Combined = 21 ± 1 yrs CON = 22 ± 1 yrs Male Healthy sedentary	20 weeks 3 d per week	Supervised Free weights, weight machines and body weight 3 sets at 50%1 RM	Baseline, 8 and 12 weeks Follow up at 24 and 32 weeks	Grants from the Ministry of Health, Labour and Welfare (H18-J-W-002), Japan Society for the Promotion of Science (17300226), and the National Institutes of Health in the US (AG20966).
Kell & Asmundson 2009	UK	RT = 40.1 ± 8.7 yrs AT = 36.7 ± 8.9 yrs CON = 35.3 ± 7.3 yrs Male and female Chronic lumbar pain	16 weeks 3 d per week	Supervised Free weights, weight machines and body weight 4 sets of 10 reps at 53–72% 1RM	Baseline, 8 (not controls) and 16 weeks	Support from the Saskatchewan Health Research Foundation (New Investigator Grant) and the University of Alberta, Augustana Campus (travel grant).
Kemi et al. 2011	Iran	RT = 20.8 ± 2.4 yrs CON = 23 ± 2.9 yrs Female Healthy sedentary	8 weeks 3 d per week	Supervised Free weights 5 sets of 5 reps at 85% 1RM	Baseline and 8 weeks	
Kemmler et al. 2016	Germany	HIT = 42.9 ± 5.4 yrs CON = 42.5 ± 5.6 yrs Male Healthy sedentary	22 weeks 2-3 d per week	Supervised Weight machines Single set to failure of 6-8 reps	Baseline and 22 weeks	The authors are grateful for the support of the Staedtler-Stiftung (Nürnberg, Germany), Kieser Training (Erlangen, Germany), Post SV Nürnberg (Nürnberg, Germany), and Protein4you (Saarlouis, Germany).
Khorvash et al. 2012	USA	Total cohort = 25.1 ± 3.2 yrs Male Depression and anxiety	10 weeks 2 d per week	Supervision not reported Free weights, weight machines and body weight	Baseline and 10 weeks	
Kim et al. 2011	Switzerland	Traditional RT = 20.8 ± 0.8 yrs Super slow RT = 19.5 ± 0.3 yrs CON = 21.5 ± 0.8 yrs Female Healthy sedentary	4 weeks	Supervision not reported Weight machines Traditional RT: 3 sets of 8 reps at 80% 1RM Super slow RT: 1 set to fatigue at 50% 1RM	Baseline and 4 weeks	
Kriemler et al. 2013	Korea	RT = 19 yrs AT = 23.8 yrs CON Swiss = 20.3 yrs CON German = 19.5 yrs Male and female Cystic fibrosis	24 weeks 3 d per week	Supervision for 1 session a week 1 set of 6-9 reps at 10RM	Baseline, 12 and 24 weeks Follow up at 52 and 104 weeks	Grant from the Swiss CF Foundation and the German Mukoviszidose e.V.
Ku et al. 2010	Korea	RT = 55.7 ± 6.2 yrs AT = 55.7 ± 7 yrs CON = 57.8 ± 8.1 yrs Female Type 2 diabetes	12 weeks 4 d per week	Supervised Elastic resistance bands 3 sets of 15-20 reps	Baseline and 12 weeks	

Kwon et al. 2010	Korea	RT = 55.7 ± 6.2 yrs CON = 57 ± 8 yrs Female Type 2 diabetes	12 weeks 3 d per week	Supervision not reported Elastic resistance bands 3 sets of 10-15 reps	Baseline and 12 weeks	Supported by Korean Diabetes Clinical Research Institution.
Kwon et al. 2011	Canada	RT = 56.3 ± 6.1 yrs AT = 55.5 ± 8.6 yrs CON = 58.9 ± 5.7 yrs Female Type 2 diabetes	12 weeks 3 d per week	Supervision not reported Elastic resistance bands 3 sets of 10-15 reps	Baseline and 12 weeks

F and a pre-doctoral fellowship from the Public University of Navarre.
Zavanela et al. 2012	Brazil	Age not reported Male Healthy sedentary	24 weeks 3-4 d per week	Supervised Free weights and weight machines 3 sets of 10–12 reps at 10–12RM	Baseline and 24 weeks	

**Table 3.** Populations used in the included studies.

	<b>Population</b>	<b>Number</b>	<b>Percent</b>
<b>Healthy</b>	Sedentary men and women	46	25.6
	Elderly men and women	30	16.7
	Physically active adults aged 18-35 years	20	11.1
	Postmenopausal women	5	2.8
<b>Clinical</b>			
<i>Cardiac</i>	Pre-hypertensive and newly diagnosed/never-treated hypertensive	3	1.7
	Coronary bypass graft	1	0.6
	Stable coronary heart failure	1	0.6
	Cardiac rehabilitation	1	0.6
<i>Cancer</i>	Breast cancer	3	1.7
	Disseminated germ cell cancer	1	0.6
	Prostate cancer	1	0.6
<i>Non-cancer</i>	Type 2 diabetes	18	10
	Sedentary obese/overweight	14	7.8
	Metabolic risk factors or syndrome	5	2.8
	Peripheral artery disease	4	2.2
	Chronic obstructive pulmonary disease	4	2.2
	Kidney transplant	3	1.7
	Musculoskeletal (e.g. osteoporosis, osteopenia or osteoarthritis)	2	1.1
	Haemodialysis	2	1.1
	Non-alcoholic fatty liver disease	2	1.1
	Polycystic ovary syndrome	1	0.6
	HIV/AIDS	1	0.6
	Trapezius myalgia	1	0.6
	Total hip arthroplasty	1	0.6
	Chronic lumbar pain	1	0.6
	Cystic fibrosis	1	0.6
	Young men with depression/anxiety	1	0.6
	Impaired glucose tolerance	1	0.6
	Chronic airflow limitation	1	0.6

**Table 9.** GRADE summary of findings.

Outcome		Anticipated absolute effects (95% CI)		Number of participants (RCTs)	Certainty
		Risk with no exercise control or usual care	Risk with resistance exercise training		
Cardiovascular morbidity and mortality		Could not be calculated due to lack of reporting.			
SBP (mmHg)	ST	The mean SBP – ST was <b>115.45 mmHg</b>	MD <b>3.17 mmHg lower</b> (6.95 lower to 0.6 higher)	116 (4 RCTs)	⊕○○○ VERY LOW a,b,c
	MT	The mean SBP – MT was <b>122.8 mmHg</b>	MD <b>4.02 mmHg lower</b> (5.92 lower to 2.11 lower)	1456 (46 RCTs)	⊕○○○ VERY LOW a,c,d
	LT	The mean SBP – LT was <b>131.6 mmHg</b>	MD <b>4.88 mmHg lower</b> (10.55 lower to 0.78 higher)	346 (7 RCTs)	⊕⊕○○ LOW a,c
MAP (mmHg)	ST	The mean MAP- ST was <b>86.5 mmHg</b>	MD <b>3.31 mmHg lower</b> (6.86 lower to 0.78 higher)	67 (3 RCTs)	⊕○○○ VERY LOW a,b,c,d
	MT	The mean MAP- MT was <b>79.6 mmHg</b>	MD <b>1.57 mmHg lower</b> (4.6 lower to 1.46 higher)	238 (10 RCTs)	⊕○○○ VERY LOW a,b,c,d
DBP (mmHg)	ST	The mean DBP – ST was <b>65.2 mmHg</b>	MD <b>1.44 mmHg lower</b> (4.73 lower to 1.86 higher)	52 (3 RCTs)	⊕○○○ VERY LOW a,b,c
	MT	The mean DBP – MT was <b>74.3 mmHg</b>	MD <b>1.73 mmHg lower</b> (2.88 lower to 0.57 lower)	1418 (45 RCTs)	⊕⊕○○ LOW a,c
	LT	The mean DBP - LT was <b>76.0 mmHg</b>	MD <b>4.93 mmHg lower</b> (8.58 lower to 1.28 lower)	346 (7 RCTs)	⊕○○○ VERY LOW a,b,c,d
RHR (bpm)	ST	The mean RHR– ST was <b>72 bpm</b>	MD <b>2.66 bpm lower</b> (7.55 lower to 2.23 higher)	30 (2 RCTs)	⊕○○○ VERY LOW a,b,c,d
	MT	The mean RHR– MT was <b>67.8 bpm</b>	MD <b>0.35 bpm higher</b> (1.44 lower to 2.13 higher)	977 (35 RCTs)	⊕○○○ VERY LOW a,c,d
	LT	The mean RHR – LT was <b>57.4 bpm</b>	MD <b>0.48 bpm lower</b> (3.12 lower to 2.17 higher)	142 (5 RCTs)	⊕○○○ VERY LOW a,b,c,e
Flow Mediated Dilatation (%)		The mean Flow Mediated Dilatation was <b>7.8 %</b>	MD <b>1.69 % higher</b> (0.97 higher to 2.41 higher)	138 (6 RCTs)	⊕⊕○○ LOW a,c
Total Cholesterol (mg/dL)	ST	The mean Total Cholesterol – ST was <b>179.3 mg/dL</b>	MD <b>5.55 mg/dL lower</b> (9.62 lower to 5.47 higher)	146 (3 RCTs)	⊕○○○ VERY LOW a,c,e
	MT	The mean Total Cholesterol – MT was <b>180.9 mg/dL</b>	MD <b>0.57 mg/dL higher</b> (5.63 lower to 6.77 higher)	882 (32 RCTs)	⊕○○○ VERY LOW a,c,d
	LT	The mean Total Cholesterol – LT was <b>198.6 mg/dL</b>	MD <b>8.71 mg/dL lower</b> (30.83 lower to 13.4 higher)	212 (8 RCTs)	⊕○○○ VERY LOW a,b,c,d,e
HDL-chol (mg/dL)	ST	The mean HDL-Chol – ST was <b>53.8 mg/dL</b>	MD <b>0.82 mg/dL higher</b> (5.4 lower to 7.03 higher)	146 (3 RCTs)	⊕○○○ VERY LOW a,b,c,e
	MT	The mean HDL-Chol – MT was <b>53.3 mg/dL</b>	MD <b>2.35 mg/dL higher</b> (0.66 lower to 5.35 higher)	1114 (38 RCTs)	⊕○○○ VERY LOW a,c,d
	LT	The mean HDL-Chol – LT was <b>53.5 mg/dL</b>	MD <b>2.79 mg/dL higher</b> (0.69 lower to 6.82 higher)	339 (9 RCTs)	⊕⊕○○ LOW a,c
LDL-chol (mg/dL)	ST	The mean LDL-Chol – ST was <b>105.6 mg/dL</b>	MD <b>5.1 mg/dL lower</b> (11.09 lower to 0.9 higher)	146 (3 RCTs)	⊕○○○ VERY LOW a,b,c,e
	MT	The mean LDL-Chol - MT was <b>110.1 mg/dL</b>	MD <b>2.86 mg/dL lower</b> (8.77 lower to 3.05 higher)	1000 (31 RCTs)	⊕○○○ VERY LOW a,c,d
	LT	The mean LDL-Chol - LT was <b>118.3 mg/dL</b>	MD <b>3.69 mg/dL lower</b> (10.99 lower to 3.6 higher)	265 (6 RCTs)	⊕○○○ VERY LOW a,b,c
Triglycerides (mg/dL)	ST	The mean Triglycerides - ST was <b>115.2 mg/dL</b>	MD <b>3.63 mg/dL lower</b> (17.45 lower to 10.2 higher)	146 (3 RCTs)	⊕○○○ VERY LOW a,b,c,e
	MT	The mean Triglycerides - MT was <b>91.8 mg/dL</b>	MD <b>3.99 mg/dL lower</b> (8.78 lower to 0.8 higher)	1165 (37 RCTs)	⊕○○○ VERY LOW a,c,d
	LT	The mean Triglycerides - LT was <b>102.7 mg/dL</b>	MD <b>2.82 mg/dL lower</b> (14.98 lower to 9.33 higher)	265 (6 RCTs)	⊕○○○ VERY LOW a,b,c

<b>Fasted insulin (µU/ml)</b>	<i>MT</i>	The mean Insulin (fasted) – MT was <b>16.2</b> µU/ml	MD <b>1.11 µU/ml lower</b> (1.74 lower to 0.49 lower)	590 (20 RCTs)	⊕○○○ VERY LOW <sup>a,c,d</sup>
	<i>LT</i>	The mean Insulin (fasted) - LT was <b>13.8</b> µU/ml	MD <b>0.4 µU/ml lower</b> (1.62 lower to 0.81 higher)	179 (4 RCTs)	⊕○○○ VERY LOW <sup>a,b,c,d</sup>
<b>HOMA-IR</b>	<i>MT</i>	The mean Insulin Resistance (HOMA) – MT was <b>6.1</b>	MD <b>1.22 lower</b> (2.29 lower to 0.15 lower)	184 (9 RCTs)	⊕○○○ VERY LOW <sup>a,b,c,d</sup>
	<i>LT</i>	The mean Insulin Resistance (HOMA) – LT was <b>3.8</b>	MD <b>0.18 lower</b> (0.64 lower to 0.27 higher)	71 (3 RCTs)	⊕○○○ VERY LOW <sup>a,b,c</sup>
<b>Fasted glucose (mg/dL)</b>	<i>ST</i>	The mean Glucose – ST was <b>87.3</b> mg/dL	MD <b>3.39 mg/dL lower</b> (6.9 lower to 0.11 higher)	122 (2 RCTs)	⊕○○○ VERY LOW <sup>a,b,c</sup>
	<i>MT</i>	The mean Glucose – MT was <b>100.7</b> mg/dL	MD <b>2.39 mg/dL lower</b> (4.47 lower to 0.31 lower)	984 (34 RCTs)	⊕○○○ VERY LOW <sup>a,c,d</sup>
	<i>LT</i>	The mean Glucose – LT was <b>92.3</b> mg/dL	MD <b>0.7 mg/dL lower</b> (2.8 lower to 2.67 higher)	271 (7 RCTs)	⊕○○○ VERY LOW <sup>a,b,c,d</sup>
<b>CRP (mg/L)</b>	<i>ST</i>	The mean hs-CRP – ST was <b>2.4</b> mg/L	MD <b>0.13 mg/L lower</b> (0.25 lower to 0.01 lower)	82 (2 RCTs)	⊕○○○ VERY LOW <sup>a,b,c,e</sup>
	<i>MT</i>	The mean hs-CRP – MT was <b>3.2</b> mg/L	MD <b>0.11 mg/L lower</b> (0.6 lower to 0.38 higher)	394 (12 RCTs)	⊕○○○ VERY LOW <sup>a,c,d</sup>
<b>VO<sub>2</sub>max (ml/kg/min)</b>	<i>ST</i>	The mean VO <sub>2</sub> max – ST was <b>28.6</b> ml/kg/min	MD <b>2.07 ml/kg/min higher</b> (0.75 higher to 3.39 higher)	308 (9 RCTs)	⊕○○○ VERY LOW <sup>a,b,c</sup>
	<i>MT</i>	The mean VO <sub>2</sub> max - MT was <b>28.9</b> ml/kg/min	MD <b>1.07 ml/kg/min higher</b> (0.38 higher to 1.76 higher)	1454 (48 RCTs)	⊕○○○ VERY LOW <sup>a,c,d,e</sup>
	<i>LT</i>	The mean VO <sub>2</sub> max - LT was <b>23</b> ml/kg/min	MD <b>1.22 ml/kg/min higher</b> (0.44 higher to 2.0 higher)	399 (11 RCTs)	⊕○○○ VERY LOW <sup>a,c,e</sup>

CI - Confidence interval; RCTs – randomised control trials; MD – mean difference; ST – short term; MT – medium term; LT – long term; SBP – systolic blood pressure; DBP - diastolic blood pressure; MAP – mean arterial pressure; RHR – resting heart rate; HDL-chol – high density lipoprotein cholesterol; LDL-chol – low density lipoprotein cholesterol; HOMA-IR – insulin resistance; CRP – C-reactive protein; VO<sub>2</sub>max – aerobic capacity.

a – Downgraded due to being a surrogate outcome.

b – Downgraded due to potential for a recommendation or clinical course of action differing if the upper versus the lower boundary of the CI represented the truth and/or a sample size <400.

c – Publication bias suspected after inspection of funnel plots.

d – Inconsistent due to high heterogeneity, non-overlap of CI and/or markedly dissimilar point estimates.

e – Risk of bias was judged to be high.

**Table 8.** Sensitivity analysis of the short- (ST), medium- (MT) and long-term (LT) effects of RET on cardiometabolic outcomes.

Outcome		Number of studies	Number of participants		Mean difference [95% CI]	P values	Heterogeneity
